Title: Description: Perfect Score: Sequence:

PAM 150 Gap 11 Scoring table:

69111 seqs, 25083644 residues Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

swiss-prot35 1:swiss1

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 41.687; Variance 80.083; scale 0.521

Mean 29.691; Variance 135.127; scale 0.220 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#### ALIGNMENTS

The protein sequence of hPES was deduced from the cDNA sequence obtd. by screening a human genomic library in EMBL3. hPES can be used to screen anti-inflammatory agents. An anti-body against a peptide specific to hPES can be made, and used for the determination of the protein.

Novel islet cell antigen-related protein tyrosine phosphatase resequising auto-antibodies associated with insulin useful for recognising auto-antibodies associated with insulin dependent diabetes mellitus

Claim 4: Page 57-63; 67pp; English.

Human islet cell antigen-related protein tyrosine phosphatase

CI (RR-PPP) (WI8092) has the properties of an insulin-dependent

Ci (RR-PPP) (WI8092) has the properties of an insulin-dependent

Ci (alabetes mellitus (IDDM)-associated autoantigen. Its amino acid

sequence was deduced from CDNA clones (T67296) obtd. from human

compared and brain cDNA libraries. Complete, partial (see also

WI8091) and cytoplasmic region (see also w18093) IRR-PTP

CO propeptides can be produced using host-vector systems and used,

CO either as an alternative to autoantigen IA-2 or in combination with

IR-2, for the diagnosis of IDDM, e.g. to screen for or predict the

CO conset, presence or development of IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 4; Page 34-38; Sipp; English.
A cDNA clone was obtd. (see T06027) from a HeLa cell cDNA library that encoded a novel density-enhanced Type III receptor-like PTP, designated hubEp-1 (R85203). hubEp-1 is useful for the study of PTPs and for the development of therapeutic or prophylactic cpds. e.g. for prevention of abnormal or malignant cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12-FBB-1996 (first entry)

R Protein tyrosine phosphatase MOT12 - used to develop products for the diagnosis and treatment of, e.g. cell proliferative disorders.

T diabetes and immune disorders

Claim 9: Fig 1: 64pp; English.

This protein sequence comprises a novel human receptor-type protein tyrosine phosphatase, designated MOT12, suggested to play a role in the growth, differentiation and survival of neurons in the adult. The amino acid sequence was deduced from a coding sequence (see 195368) of overlapping cDNA clones isolated from the adult. The amino acid sequence was deduced from a coding sequence (see 195368) of overlapping cDNA clones isolated from candate nucleus and pancreas cDNA libraries. MOT12 expression is highly restricted, being found only in adult brain and pancreas in neurosecretory cell types. Polypeptides, including those that comprise residues 1-614, 615-706 or 707-1082 of MOT12 or comprise MOT12 lacking one or more of the extracellular, transmembrane or intracellular domains, can be expressed in methods transgenic animals and antibodies can be used in methods transgenic animals and antibodies can be used in methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WI8092;

Navigand for the Flt3 tyrosine kinase receptor - and related nucleic acid, vectors, host cells and antibodies, useful for treating abnormal cell physiology and proliferation, e.g. cancer, also for diagnosis and drug screening.

Tolaim 11: page 79-80; 90pp; English.

A cDNA library from the human stromal cell line 29SV48, in pwEl8S, was screened with an 800 bp fragment derived from mouse clone T118. This fragment encompasses the coding region conserved between two mouse clones, T118 and T110. Approx. 20 positive clones were selected and partially sequenced. Two clones, S86 and S109, were found to be approx. 75% homologous to the mouse clones over the first 163 AAs. Clone S86 continued clones, S86 and S109, were found to be approx. 75% homologous clones, s86 and s109, were found to be approx. 75% homologous clones solver the first 163 AAs. Clone S86 continued clones were degree, for an overall homology of 66%. Clones T118 and selected mouse residue 163 (human residue 160). An additiona mouse the common and divergent portions of the mouse ligand. Sequence 232 AA;
                                                                                       Insolated ligands for flt 3 receptors - useful for treating anaemia, AIDS and various cancers Disclosure; page 25-7; 33pp; English.

CDNA encoding mouse flt3-ligand (flt3-L) was isolated from a CDNA library of T-cell line P7B-0.3A4 in CV-1/EBNA-1 cells using a slide autoradiography method. Flt3-L stimulates production of progenitor and stem cells, and can be used e.g. Sequence 231 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 89; DB 13; Length 232;

                                                                                                                                                                                                                                                                                                                                                                                                        õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating or preventing microbial infections - using cecropin(s), attacin(s), lysozyme(s), S protein from lambda phage, E protein from pHI x174 or protein from phage 22.

Claim 108; page 58; 64pp; English.

The truncated E protein is an antimicrobial polypeptide. DNA encoding the protein is used to transform animal cells to express the protein, proteins may also be admin. to humans and animals for preventing or transforms, eg brucellosis, malarial infection. The proteins may also be admin. to humans and animals for preventing or transforms, eg brucellosis, malarial infection, see also P94254-P94258.

Mean 22.110; Variance 87.356; scale 0.253 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Protur is cleaved to a lower molecular weight 'mature' form, pref. 17kD, which, in its multimeric (usually trimeric) form, is substantially involved in producing life-threatening physiological changes associated with sepsis. ProTNF is cleaved by convertuse. One TNF convertuse is serine protease proteinase-3, also called PR-3, P-29B or myeloblasin A suitable

treatment of septic shock, Theumatoid arthritis, From.

Example 2; Page 82; 96pp; English.

Contract sequence represents the preproper 3. PR-3 is a active recombinant human neutrophil protease-3. PR-3 is a serine protease, and is a tumour neutrophil protease-3. PR-3 is a serine protease, and is a tumour neutrophil protease-3. PR-3 is a serine protease, and is a tumour necrosis factor alpha (TNFalpha) convertase. The cDNA encoding this conscribed from the HL60 cell clone MX17. The mature PR-3 can be used in the method of the invention for identifying agents that the invention for identifying agents that the protopha to mature TNFalpha. In the method, the cleavage of proTNFalpha is measured by a colourimetric assay.

Che cleavage of the proTNFalpha is measured by a colourimetric assay.

Chis is then repeated in the presence of a test compound that is thought to inhibit this process. The results of the two reactions are then compared to determine whether the test compound is an inhibitor. The cleavage inhibitors can be used in the treatment of septic shock, rheumatoid arthritis, cachexia, cerebral malaria, ischaemia/reperfusion injury, graff-host disease, autoimmune diseases, and AIDS. PR-3 can be used to treat unwanted B cell/T cell interaction by contacting it with Sequence 256 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

production of tylosin-related polyketide compounds claim 9; Pages 103-109; 220pp; English.

Claim 9; Pages 103-109; 220pp; English.

Wa2601-Wa22605 represent proteins encoded by the tylactone synthase gene cluster of the invention. The gene cluster is also referred to as the tyla gene, and was isolated from Streptomyces fradiae. These sequences are multifunctional proteins which direct the synthesis of the polyketide tylactone, isolated from Streptomyces fradiae. Tylactone is the basic building block of the antibiotic tylosin. The DNA sequence can be modified so as to alter the type of carboxylic acids incorporated, the number of carboxylic acids incorporated and/or the post-condensation reactions performed, thereby resulting in novel tylosin-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 55; Fig 23; 91pp; English.

3 Polypeptide sequences (W19629-30 and W00918) can be deduced from the vep ORT1 polyfectide synthase (PKS) gene cluster (T68715) of Streptomyces venezuelae. The sequence data indicate that the PKS gene cluster encodes a polyene of 12 carbons. The vep gene cluster contains 5 PKS modules, plus a 5' loading module and a 3' end domain. Each of the sequenced modules includes a keto-ACP, an acyltransferase, a dehydratase, a keto-reductase and an acyl carrier protein domain. A novel expression cassette encoding the first module from the vep gene cluster and module 7 from the Streptomyces trylp gene cluster has polyhydroxyalkanoate (PHA) monomer synthase activity and can be used for PHA prodn. In host (esp. insect) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Expression cassettes for production of polyhydroxyalkanoate(s) provide wide range of biodegradable polymers for medical or

             Ecdysteroid dependent regulation of genes in mammalian cells - for induced expression of heterologous genes
Disclosure; Fig 1; 45pp; English.
This sequence represents an ecdysteroid receptor DRR23alpha. DHR23-
alpha is a Drosophila steroid receptor homologue which can function as
a ligand-dependant transcription factor in mammalian cells when induced
by specific ecdysteroids such as DHR23alpha. The activity of DHR33-
alpha is induced upon administration of certain ecdysteroids but not
any of the mammalian hormones tested. DHR23alpha has been reported to
                                                                                                                                                                                                             regulate transcription of genes containing ecdysone response elements
in Drosophila tissue culture cells treated with 20-0H ecdysone.

claim 24; Page 103; 126pp; English.

The amino acid sequence codes for the (20-0H) ecdysone receptor protein which is part of the insect steroid receptor superfamily. It can be used to screen for ligands specific for the insect steroid receptors which can be used as highly specific and highly active pesticides which are biodegradable. See also R13791-R13794.

Novel human type alpha-1 (XVIII) collagen is characterised by triple helical domains containing the GXVGX'Y' motif (where X, Y, X' and Y' represent any amino acid), the helical domains being separated and flanked by non-triple helical regions which may provide flexibility. Alpha-1 collagen is expressed in multiple tissues. especially liver, lung and kidney. A claimed plasmid comprising alpha-1 collagen nucleic acid (see T84484) and an expression control sequence can be used to express recombinant collagen in prokaryotic or eukaryotic (especially mammalian) host cells. The alpha-1 collagen may be used to treat a patient suffering from a disease associated with cartilage degradation, and for supplementing collagen. It can also be used as a connective tissue filler (e.g. for plastic surgery), can be interposed between a dermal equivalent and skin to improve adhesion, and as a substrate on which to grow epithelium. The addition of glycosans makes alpha-1 collagen a better carrier for fibroblast growth factor, and imparts greater tensile strength.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid encoding human alpha-1 collagen - for production of recombinant alpha-1 collagen, for use in the treatment of cartilage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    r,_motif

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                    Sequence 2, Application US/08494168
Patent No. 5731192
GENERAL INFORMATION:
APPLICANT: Reeders, Stephen T.
APPLICANT: 2hou, Jing
TITLE OF INVENTION: Collagen COL4A6: Gene, Protein and Method
TITLE OF INVENTION: of Detecting Collagen Deficiency
NUMBER OF SEQUENCES: 10
CORRESPONDENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
STREET: 3000 K Street, N.W., Suite 500
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 2, Application US/08115680
Patent No. 5437863
GENERAL INFORMATION:
APPLICANT: Williams, David A.
APPLICANT: Clark, Steven C.
TITLE OF INVENTION: Method of Treating Cell Damage or TITLE OF INVENTION: Depletion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 1694;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 62; DB 1; Length lost

Sequence 14, Application US/07745382
Patent No. 5270181
GENERAL INFORMATION:
APPLICANT: McCOy, John
APPLICANT: LeVallie, Edward
TITLE OF INVENTION: Peptide and Protein Fusions To
TITLE OF INVENTION: Thioredoxin and Thioredoxin-Like Molecules
NUMBER OF SEQUENCES: 24
CORRESPONDENCE ADDRESS:
ADDRESSE: Genetics Institute, Inc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                             CURRENT APPLICATION DATA:

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.553; Variance 48.558; scale 0.650

-!- FUNCTION: THE SIGMA FACTOR IS AN INITIATION FACTOR THAT PROMOTES ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND THEN IS RELEASED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIGMA-54 FAMILY.

HORINGUCHI S.;

SUBMITTED (JAN-1995) TO EMBL/GENBAUK/DDBJ DATA BANKS.

- FUNCTION: INVOLVED IN THE REGULATION OF SECONDARY METABOLISM BY PHOSPHORYLAATING, ON BOTH SER AND THR, THE AFSR GLOBAL REGULATORY C PROSPHORYLAATING, ON BOTH SER AND THR, THE AFSR GLOBAL REGULATORY AND PHOSPHORYLATED AT THR AND SER RESIDUES.

- I- PIM: AUTOPHOSPHORYLATED AT THR AND SER RESIDUES.

- I- SIMILARITY: WITH THE CONSERVED CATALYTIC DOMAINS OF SER/THR-PROTEIN KINASE.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 41.408; Variance 75.349; scale 0.550
